

A E DRILLING SERVICES, LLC

A E Drilling Services, LLC is pleased to add the new Geoprobe 8040 (http://www.geoprobe.com/products/machines/84_series/8040DT/8040dtdesc.htm) to our fleet. The 8040 is a revolutionary new machine equipped to advance 4.5-inch rod to depth via direct push enabling 2-inch wells to be installed without any IDW being created. Core can be obtained if desired, or omitted if not needed. 6-inch drive points can also be used to create a larger annulus if necessary. The 8040 is also equipped to drill via a 6500-foot/pound torque head, facilitating efficient auger and/or mud rotary drilling. Split spoon samples can be taken conventionally, or via the Geoprobe dual tube system, enabling SPT data to be obtained via direct push rather than the drilling method; a very safe, efficient, & IDW free method.

The Geoprobe 8040 is significantly less expensive to operate than a sonic rig, thereby making it a very competitive choice for 2-inch well projects. We look forward to offering this new technology, and utilizing it on a project with you soon.
